# moodlet

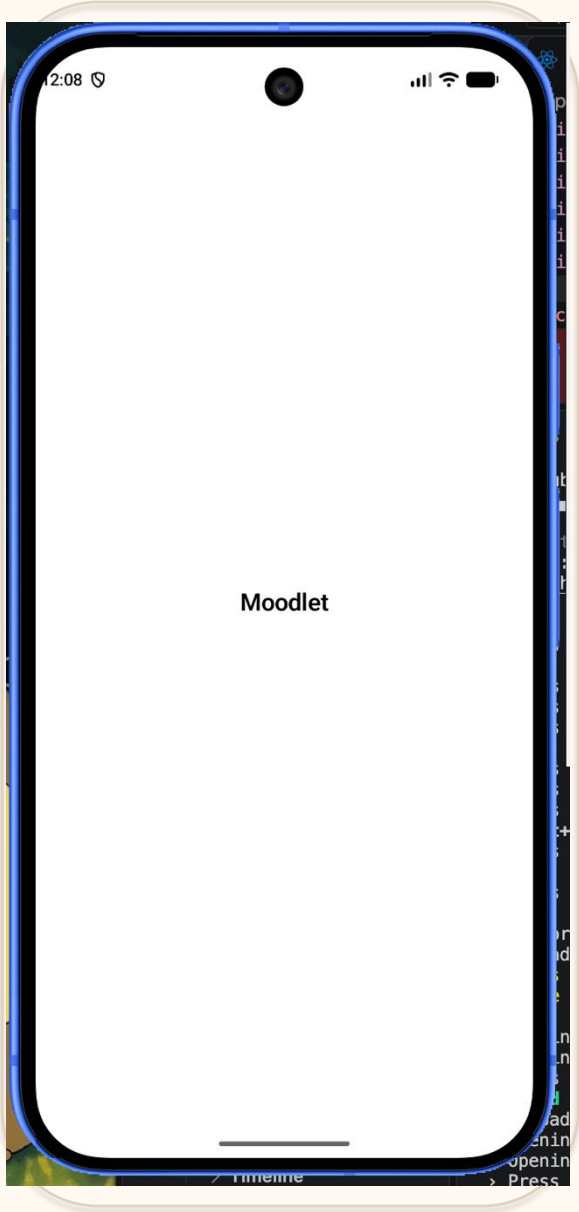

## A little mood boost project.

### Future Vision

Moodlet was inspired by my family, friends, and people around me. Today, we spend so much time communicating through screens, and sometimes expressing our feelings with words isn't easy.

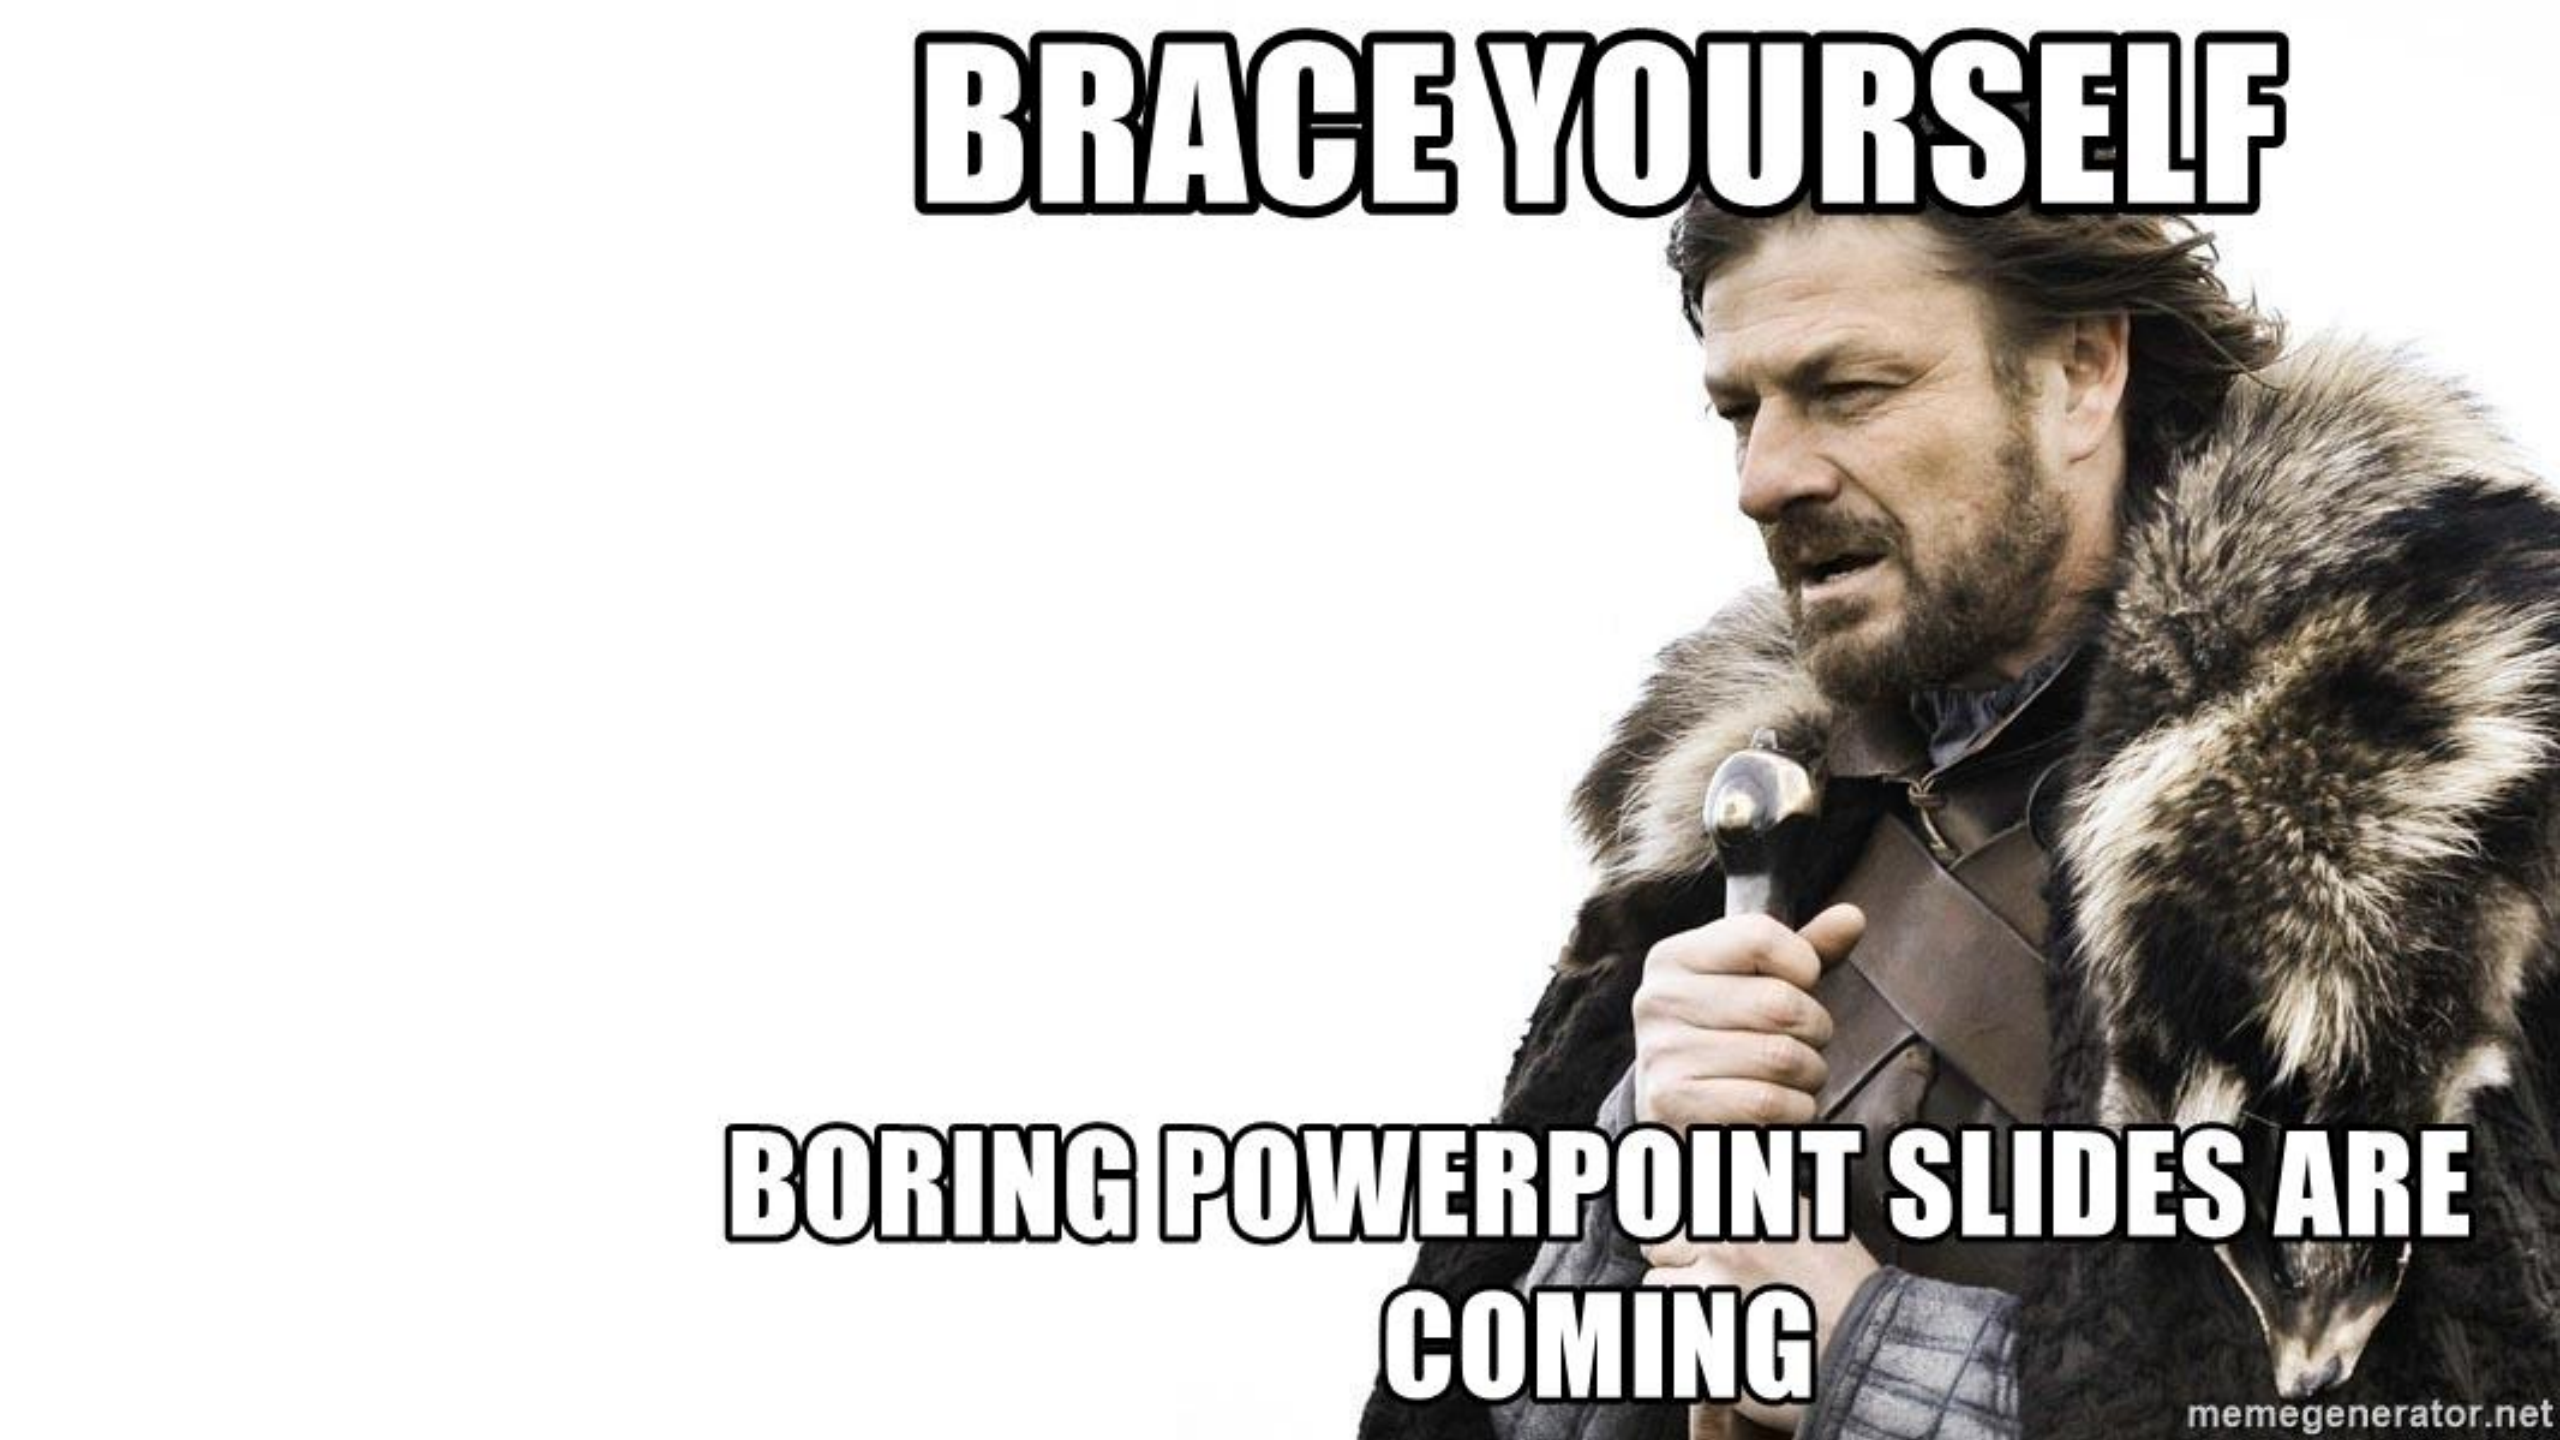

Memes and images can help us share emotions, make someone smile, and feel understood.

For now, Moodlet is a small beginning. In the future, I'd love to develop it into a real game or fun tool that helps people and individuals with communication difficulties to express their feelings more easily. It's a small idea today, but I hope it can grow into something meaningful.

# What is Moodlet?

A small interaction app for the moments of rest.

THE MOMENT

**I feel tired, stressed, bored, or a little low.**

THE RESPONSE

**Choose a mood.**

**Try one tiny challenge.**

**Unlock a reward.**

THE RESULT

**A lighthearted moment users can save and revisit.**

# From mood to reward

Five steps, each with one clear purpose.

1

## Home

Welcome and start

→

2

## Explore

Choose a mood

→

3

## Challenge

Try a tiny activity

→

4

## Reward

Reveal meme + quote

→

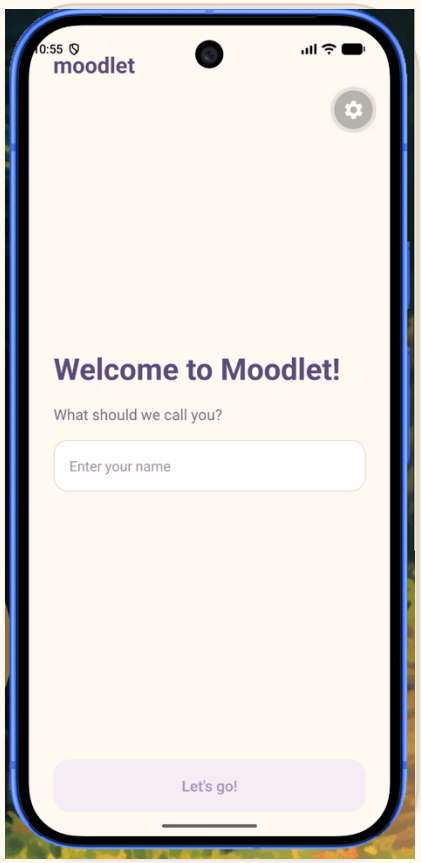

5

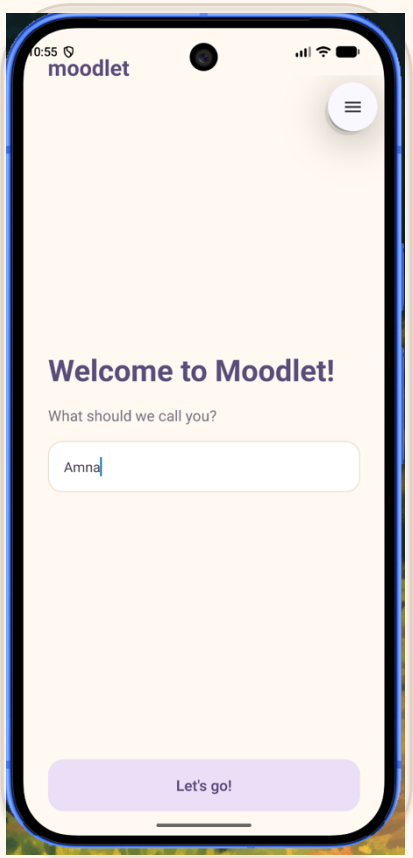

## Collection

Save and revisit

# A small personal welcome

The first-time screen asks for a name and saves it for the next visit.

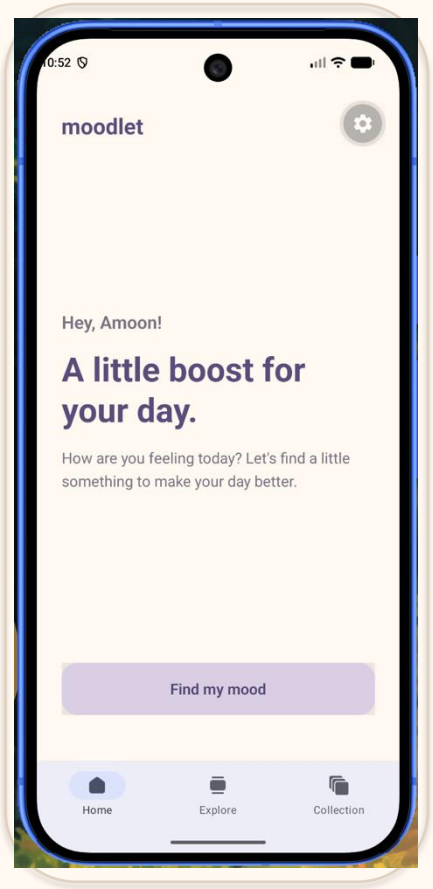

## What happens here?

- The user enters a name.
- The app checks that the field is not empty.
- The name is saved locally.
- Home uses it for a friendly greeting.

# Home: the starting point

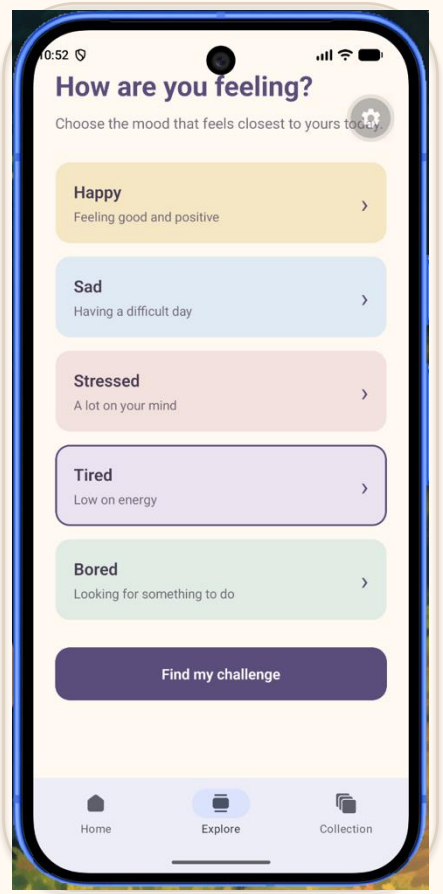

## What the user sees

- A personal greeting using the saved name.
- A short explanation of what Moodlet offers.
- One clear button to start choosing a mood.
- Bottom tabs for Home, Explore, and Collection.

# Explore: choose how you feel

The user selects one of five moods.

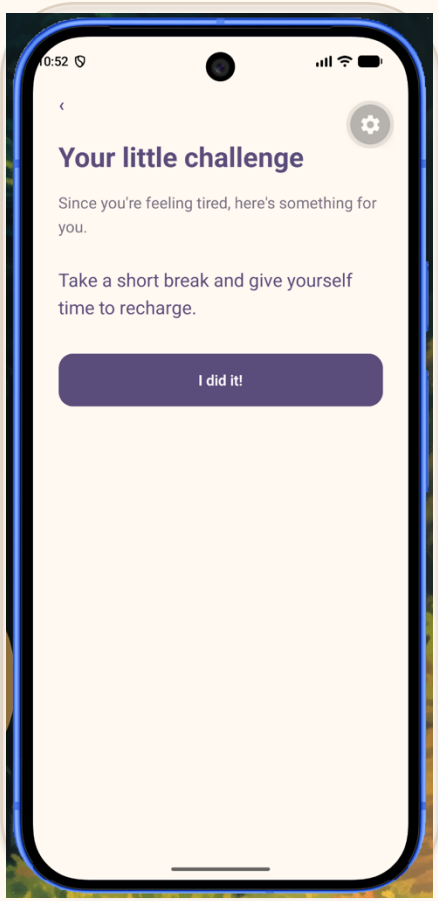

## Available moods

| | | |
|---|---|---|
| Happy | \| | feeling good and positive |
| Sad | \| | having a difficult day |
| Stressed | \| | a lot on your mind |
| Tired | \| | low on energy |
| Bored | \| | looking for something to do |

# Challenge: one small action

The challenge is connected to the mood the user selected.

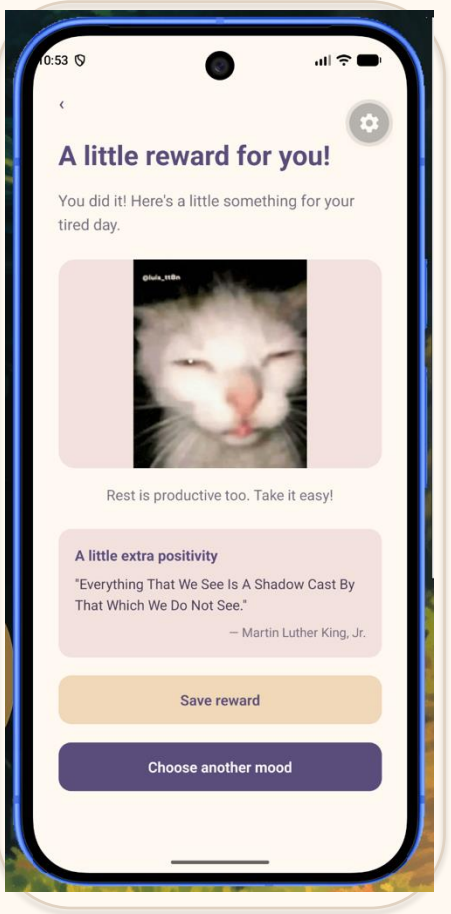

## Why this screen matters

- The screen receives the selected mood through route parameters.
- It chooses a small challenge from that mood's options.
- Some moods can show different challenges on different visits.
- The user taps “I did it!” to continue to the reward.

# Reward: meme, caption, and quote

The reward combines built-in content with a quote requested from a public API.

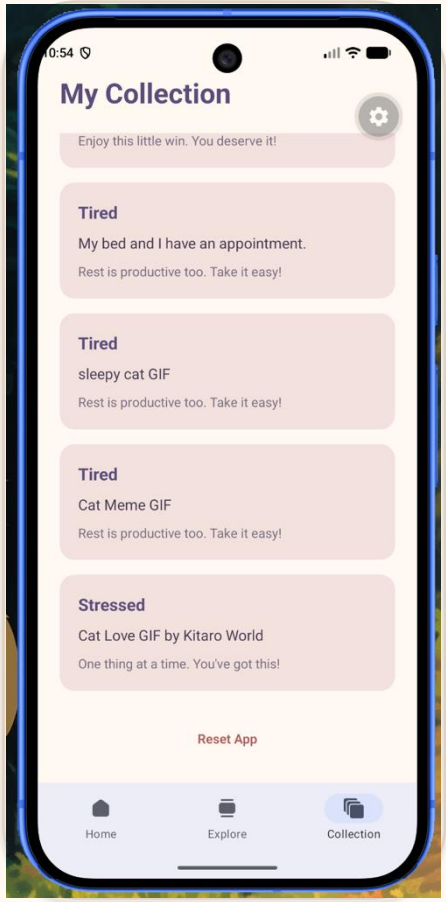

## Three parts of the reward

- A mood-matched meme or reward item.
- A short caption that connects to the challenge.
- A positive quote with its author.
- Save reward stores the complete reward for later.

# Collection: keep the rewards

Saved reward cards can be opened again.

## What's in there

- Saved rewards appear in a list.
- FlatList renders the saved items.
- A card opens its full saved reward.
- An empty message appears when nothing is saved.

# How the code is organized

Screens coordinate the experience; helpers keep repeated work in the right place.

```
src/
  app/
    (tabs)/
      index.tsx       Home
      explore.tsx     Explore
      collection.tsx  Collection
    welcome.tsx
    challenge.tsx
    reward.tsx
    saved-reward.tsx
  components/
    reusable UI
  lib/
    api.ts
    storage.ts
    types.ts
```

## Useful areas

- app/ ; screens and Expo Router navigation.
- components/ ; interface pieces that can be reused.
- lib/ ; API requests, local storage, and shared types.
- types.ts ; describes the shape of Quote and Reward data.

# Navigation and screen state

The app passes only the information the next screen needs.

NAVIGATION

**Home → Explore**

**Explore → Challenge**

**Challenge → Reward**

**Reward → Collection**

**Collection → Saved reward**

STATE

- useState holds values that can change on a screen.
- The selected mood is passed to Challenge.
- The quote is loaded when Reward opens.
- The saved reward details are passed to the detail screen.

# Getting a quote from an API

DummyJSON Quotes is public and does not require an API key.

**1 REQUEST**

fetch()
asks DummyJSON
for a random quote.

→

**2 CHECK + READ**

Check the response,
then read the JSON
data.

→

**3 DISPLAY OR FALL BACK**

Show the quote.
If the request fails,
use a built-in quote.

**Loading state: the screen waits for the quote request before enabling Save reward.**

# How Moodlet remembers

AsyncStorage keeps small pieces of data on this device.

### WHAT IS SAVED?

- The user's name.
- The user's saved rewards.
- The information remains after closing and reopening the app.

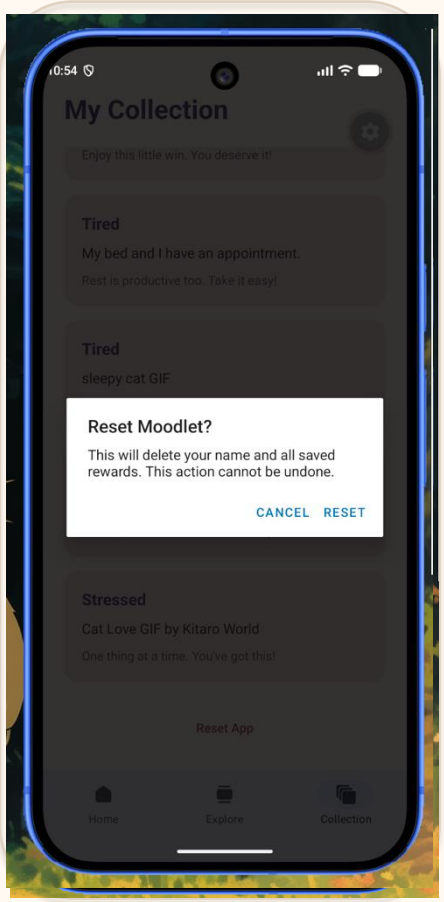

### WHY JSON?

AsyncStorage stores strings.

JSON.stringify() converts an object or array into text before saving.

JSON.parse() turns that text back into JavaScript data when loading.

# Reset means starting fresh

**The app's code can be the same on two devices, but each device has its own local storage.**

- A saved name on one device does not automatically appear on another.
- Reset clears this app's local name and saved rewards.
- A server account would be needed to sync personal data across devices.

# What I learned and what I would improve

WHAT I CAN EXPLAIN NOW

WHAT I WOULD DO NEXT

# Where I would take Moodlet next

01 • PERSONAL CONTROL

**Remove one saved reward**

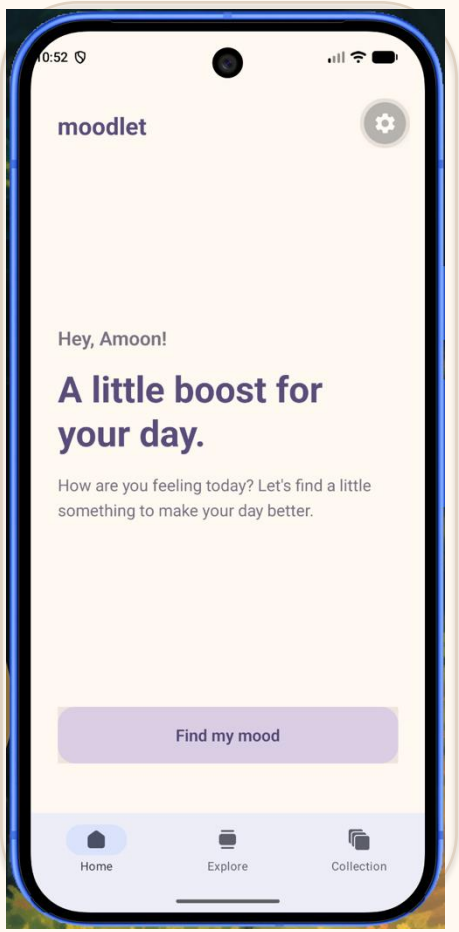

02 • MORE VARIETY

**Grow the content library**

03 • RELIABILITY

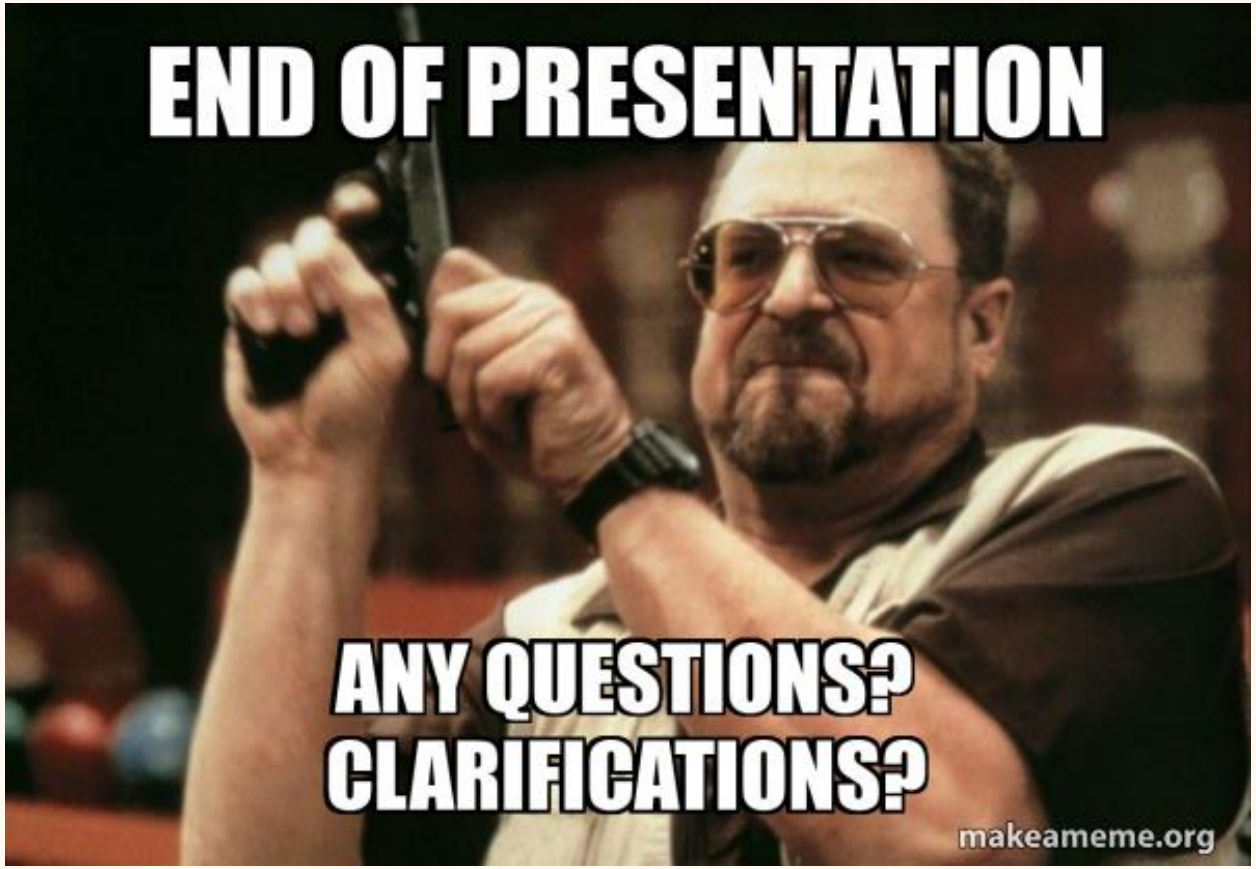

**Keep improving the experience**

# Question time!!

**If Moodlet is installed on two different phones, will the saved name and rewards automatically be identical?**

No. AsyncStorage is local to each device. To synchronize data between devices, the app would need a shared backend or account system.
